## 3. Deploy NetApp HCI with the NetApp Deployment Engine: NetApp HCI with Anthos

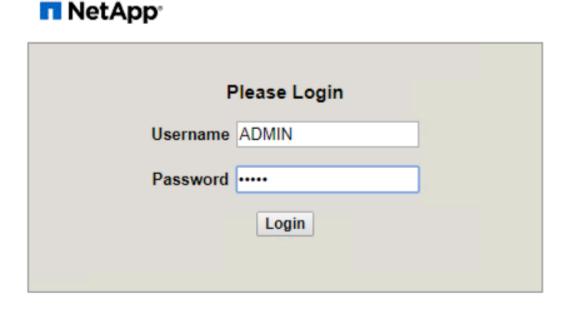

NDE delivers a simple and streamlined deployment experience for the NetApp HCI solution.

These steps begin after the nodes have been racked, and cabled, and the IPMI port has been configured on each node using the console.

A detailed guide to using NDE 1.6 to deploy your NetApp HCI system can be found here.

To Deploy the NetApp HCI solution using NDE, complete the following steps:

1. Access the out-of-band management console for one of the storage nodes in the cluster and log in with the default credentials ADMIN/ADMIN.

- 2. Click the Remote Console Preview image in the center of the screen to download a JNLP file launched by Java Web Start, which launches an interactive console to the system.
- 3. With the virtual console launched, a user can log in to the HCI Storage node, using the ADMIN/ADMIN username and password combination.
- 4. The Bond1G interface must have an IP, a netmask, and a gateway set statically; its VLAN set to 3480; and DNS servers defined for the environment.

```
Bond 10G
   Method
                         : static
   Link Speed
                         : 50000
   IPu4 Address
   IPv4 Subnet Mask
   IPv4 Gateway Address
   MTU
                           9000
   Bond Mode
                                  [ActivePassive, ALB, LACP]
   LACP Rate
                           Fast
                                 [Fast, Slow]
   Status
                         : UpAndRunning [Down, Up, UpAndRunning]
   Virtual Network Tag
   Routes
                         : Number of routes: 0.
```

Select an IP that is within the subnet you intend to use for in-band management, but not an IP you would like to use in production. NDE reconfigures the node with a production IP after initial access.

This task must only be performed on the first storage node. Afterward, the other nodes in the infrastructure are discovered by the Automatic Private IP Address (APIPA) addresses assigned to each storage interface when left unconfigured.

5. The Bond 10G interface must have its MTU setting changed to enable jumbo frames and its bond mode changed to LACP.

```
Bond 10G
   Method
                         : static
   Link Speed
                         : 50000
    IPu4 Address
    IPv4 Subnet Mask
    IPv4 Gateway Address :
    MTU
                           9000
    Bond Mode
                                  [ActivePassive, ALB, LACP]
   LACP Rate
                           Fast
                                 [Fast, Slow]
                         : UpAndRunning [Down, Up, UpAndRunning]
   Status
   Virtual Network Tag
    Routes
                          : Number of routes: 0.
```

Configure each of the four storage nodes in the NetApp HCI solution this way. The NDE process is then able to discover all the nodes in the solution and configure them. You do not need to modify the Bond10g interfaces on the two compute nodes.

- 6. After completion, open a web browser and visit the IP address you configured for the management port to start the NetApp HCI configuration with NDE.
- 7. On the Welcome to NetApp HCI page, click the Get Started button.
- 8. Check each associated box on the Prerequisites page and click Continue.
- 9. The next page presents End User Licenses for NetApp HCI and VMware vSphere. If you accept the terms, click I Accept at the end of each agreement and then click Continue.
- 10. Click Configure a New vSphere Deployment, select vSphere 6.5U2, and enter the Fully Qualified Domain Name (FQDN) of your vCenter Server. Then click Continue.

## vSphere Configuration

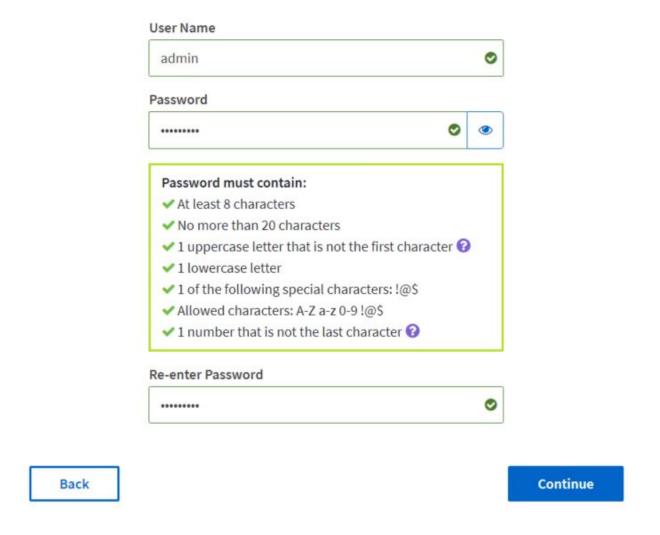

You may elect to configure a new vSphere deployment or to join an existing vSphere deployment. Configure a new vSphere deployment Configure Using vSphere Version 6.7 Update 1 Configure Using vSphere Version 6.5 Update 2 Join and extend an existing vSphere deployment If you have set up a DNS record for your new vCenter server, then configure your server using its fully qualified domain name and DNS server IP address: Configure Using a Fully Qualified Domain Name

Best Practice! vCenter Server Fully Qualified Domain Name anthos-vc.cie.netapp.com Note: The domain name must resolve to an unused IP address. DNS Server IP Address 10.61.184.251 If you have not set up a DNS record for your new vCenter server, you may configure using an IP address that we define: Configure Using an IP Address ? Note: Once defined, the IP address cannot be changed. Back Continue

11. NDE asks for the credentials to be used in the environment. This is used for VMware vSphere, the NetApp Element storage cluster, and the NetApp Mnode, which provides management functionality for the cluster. When you are finished, click Continue.

## Credentials

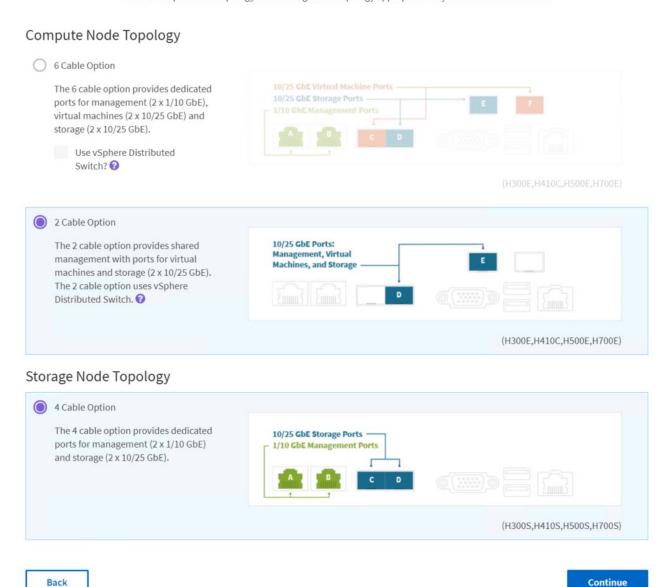

Define the user name and password that will be used for the storage cluster, vCenter, and the management node.

12. NDE then prompts for the network topology used to cable the NetApp HCI environment. The validated solution in this document has been deployed using the 2 Cable Option for the compute nodes, and the 4 Cable Option for the storage nodes. Click Continue.

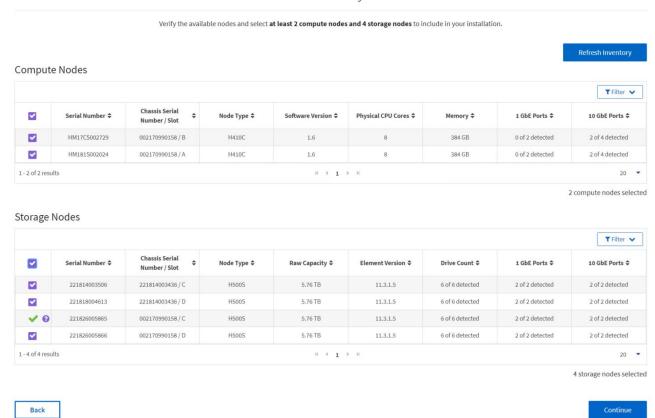

## Network Topology

Select a compute node topology and a storage node topology appropriate for your hardware installation.

13. The next page presented by NDE is the inventory of the environment as discovered by the APIPA addressed on the storage network. The storage node that is currently running NDE is already selected with a green check mark. Select the corresponding boxes to add additional nodes to the NetApp HCI environment. Click Continue.

#### Inventory

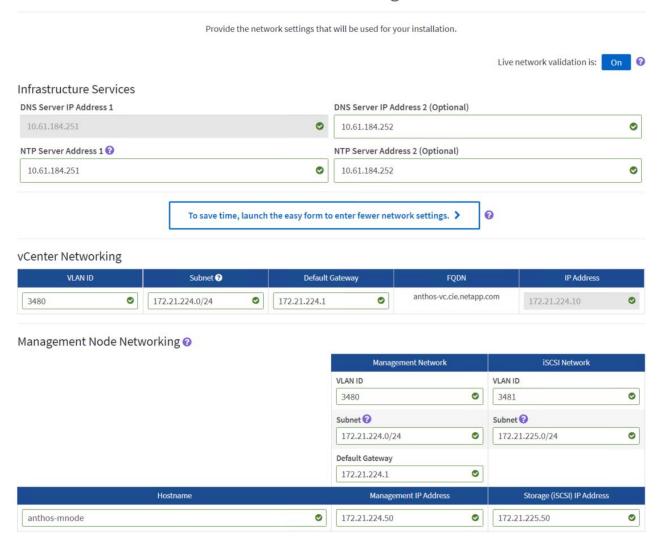

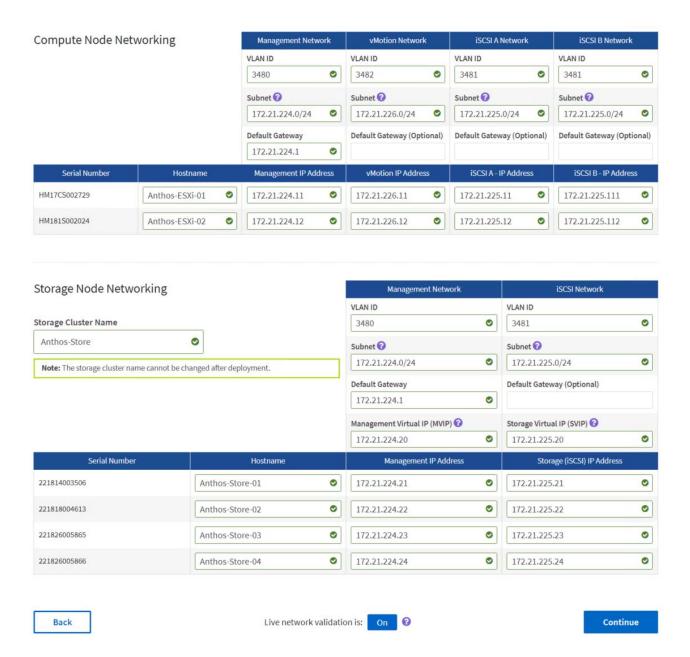

If there are any nodes missing from the inventory screen, wait a few minutes and click Refresh Inventory. If the node still fails to appear, additional investigation of environment networking may be required.

14. You must next configure the permanent network settings for the NetApp HCI deployment. The first page configures infrastructure services (DNS and NTP), vCenter networking, and Mnode networking.

### **Network Settings**

15. The next page allows you to configure each node in the environment. For the compute nodes, it allows you to configure the host name, management network, vMotion network, and storage network. For the storage nodes, name the storage cluster and configure the management and storage networks being used for each node. Click Continue.

16. On the next page, review all the settings that have been defined for the environment by expanding each section, and, if necessary, click Edit to make corrections. There is also a check box on this page that enables or disables the Mnode from sending real-time health and diagnostics information to NetApp Active IQ®. If all the information is correct, click Start Deployment.

If you want to enable Active IQ, verify that your management network can reach the internet. If NDE is unable to reach Active IQ, the deployment can fail.

17. A summary page appears along with a progress bar for each component of the NetApp HCI solution, as well as the overall solution. When complete, you are presented with an option to launch the vSphere client and begin working with your environment.

## Your setup is complete. Launch vSphere Client Configure Network Complete 🔮 Set up NetApp Cluster Complete ② Set up ESXi Complete 🔮 Set up vCenter Complete 🔮 Configure Management Node Complete 🔮 Finalize Configuration Complete 🔮 Overall Progress ▲ Export all setup information to CSV file
